Impact factor/functional relationship

We approximate the changes in welfare by income quantile (WC_{iq}) in terms of non-energy expenditures as percentage of household's income according to the following formula:

$$WC_{iq} = \frac{C_{nener,id}^0 - C_{nener,iq}}{INC_{iq}} \quad (8)$$

Monetization

Monetisation can be approached via the welfare metric that captures the changes in non-energy expenditures (as percentage of income).

Aggregation

The indicator cannot be directly aggregated with other indicators.
